Subject: 128 - Firing Ranges Alert

Hi

I am aware NIOSH focuses on work areas, however, the largest danger is to small children and pregnant women, not workers.

Lead dust levels can be astronomical and present a grave danger to small children who go with mom or dad to the firing range.

I have found lead dust levels of 500,000 micrograms per square foot in cafeteria and play areas, the residential standard is 40 $\mu\text{g}/\text{ft}^2$

This is a bigger problem than you have indicated and it should be addressed.
